Subject

Vietnamese restaurant recommendation service

Abstract

Overview of the Project

Travel review data is collected from various sources, feature values of each restaurant are extracted, restaurants are classified, travel-related questions are provided to users, and user answers are analyzed to identify preferred features. Recommend the best restaurant for the user using the appropriate recommendation algorithm.

Outline and Background

1. **Variability of restaurant information**

   Vietnam consists of various regions and cities, and each region has its own unique food culture and restaurants. However, it is difficult for these language users to decide where and what food to eat. This information is scattered from various sources such as the Internet, travel guidebooks, and recommendations from acquaintances, making it cumbersome for travelers to invest time to obtain information on local restaurants.

2. **Universal recommendation service**

   Most of them are general travel destination recommendation services that do not take into account the food style, restaurant interior, dietary restrictions and tastes that users pursue. Therefore, users obtain information about restaurants that are not suitable for them.

Key Project Features
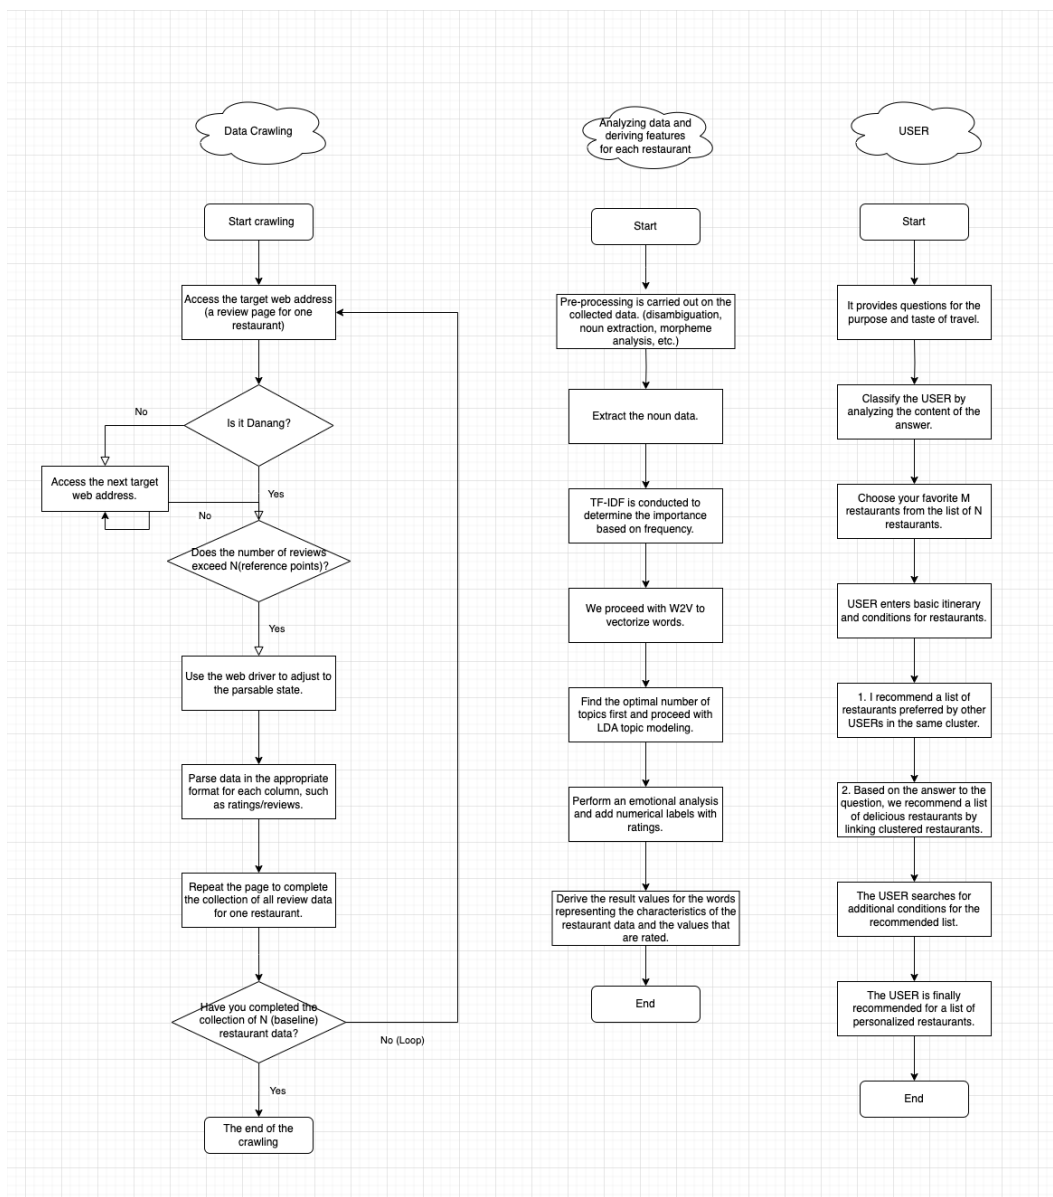

Restaurant recommendations

1. Classification classification according to characteristics

2. Identify the user's taste in food

3. estaurant recommendations

Benefit of the Project

1. Integration of various restaurant information

2. Recommended restaurants

3. Local Food and Welfare Support
